

# Common Small Business Cyber Vulnerabilities

Small businesses are vulnerable to cyber attacks and exposure to cyber risk continues to grow as we rely more on digital ways of doing business.

### POS System

Cash Register, Tablet, Smart Phone  
If you're taking payment from customers, you have access to their credit card numbers and other personal information – and so does a cybercriminal if your system is hacked.

### Landline Phone

Cybercriminals can call and ask for personal information, posing as someone you know.

### Employee Cellphone

If your employees use their smart phones to conduct business in any way, those devices are risks too. If their phone is hacked, it can be an entry point for a cybercriminal.

### Files/Papers

Data breaches are not limited to electronic data. Physical papers and files that are stolen may contain confidential or personal information that may trigger data breach reporting requirements and leave affected individuals vulnerable to identity theft.

### IoT Items

Thermostat, Networked Copy Machine, Security Systems  
When you connect devices to your network, you can introduce new vulnerabilities if they are not properly secured.

### Server

If your server is hacked, cyber criminals may gain access to confidential business information, personal and health information of employees or clients.

### Computer

Cybercriminals often try to get into your computer system by way of an employee, by emailing a malicious link or posing as an executive and requesting confidential information.
